NEVERMORE Local System Dynamics Model: Policies' definitions and interactions with key variables

June 2026

This project has received funding from the European Union's Horizon Europe research and innovation programme under grant agreement No 101056858.

Local Model Policies' Definitions

To facilitate the interpretation of the **policies** included in the **NEVERMORE Local System Dynamics (SD) model**, it is important to first understand how they are parameterized and implemented. The following section describes the user-defined inputs that govern policy activation, timing, and effectiveness, as well as the different approaches used to represent policy impacts within the model. A detailed description of all policies is subsequently provided in the table below.

The policies are parametrized within the model by modifying the following parameters:

- **SWITCH:** Activates or deactivates the policy (On/Off).
- **INITIAL YEAR:** The year in which policy implementation begins (e.g., 2023).
- **FINAL YEAR:** The year by which policy implementation is completed and the policy objective is expected to be achieved (e.g., 2030).
- **OBJECTIVE:** The target value to be reached by the end of the implementation period (e.g., a 40% reduction in urban water demand).
- **SELECT INCENTIVES:** Defines the level of policy effectiveness and the percentage of the objective achieved based on the incentive scheme selected by the user:
 - Very High Incentives
 - High Incentives
 - Medium Incentives
 - Low Incentives

Policy implementation within the model follows two main approaches:

- **Linear objective achievement:** the policy effect is represented as a gradual linear increase or decrease from the initial year of implementation to the final year. The specified policy objective is fully achieved by the end of the implementation period.
- **Incentive-based achievement:** the level of policy effectiveness depends on the incentives selected by the user. In this case, the percentage of the policy objective achieved varies according to the chosen incentive level.

Depending on the policy, these approaches may be applied independently or in combination. For some policies, the target objective is predefined by the modellers, and users only need to activate or deactivate the policy through a switch.

Further information on model can be found in **D6.6** (Technical and policy recommendations at local level), included in the [NEVERMORE Zenodo repository](#).

Policy	Definitions of policies' objectives and incentives	Units
INCREASE PROTECTED FOREST LAND	Increase in protected forest area (forest area that cannot be converted to other land uses in the model) to be achieved by the final year of policy implementation	km ²
INCREASE PROTECTED WETLANDS	Increase in protected wetlands area (wetlands area that cannot be converted to other land uses in the model) to be achieved by the final year of policy implementation	km ²
SUBSIDIES FOR AFFORESTATION	Incentives comprise four levels (0–3), representing the proportion of increase in afforestation achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
GREEN URBAN PLANNING	Increase in urban green area to be achieved by the final year of policy implementation	km ²
WATER STORAGE INCREASE (Location)	Conditions referring to the expansion of water area on another land use. Four locations (1–4) are used for expansion: level 1 = Other (all	Dmnl

Policy	Definitions of policies' objectives and incentives	Units
	land uses in the case study except urban, agricultural, and forest), level 2 = Urban, level 3 = Agriculture, and level 4 = Forest	
WATER STORAGE INCREASE (Area)	Increase in water area to be achieved by the final year of policy implementation	km ²
WATER STORAGE INCREASE (Capacity)	Increase in water storage volume to be achieved by the final year of policy implementation	hm ³
INCREASE IRRIGATED CROP	Percentage increase in irrigated crop area relative to total crop area to be achieved by the final year of policy implementation	%
INVESTMENT IN CROP ADAPTATION	Investment in crop adaptation (enhancing the crop adaptation indicator in the model) to be allocated by the final year of policy implementation	M€
CROP DIVERSIFICATION	Percentage of increase in crop diversification index (0 = no diversification; 1 = well-diversified cropping) to be achieved by the final year of policy implementation	%
INCENTIVES FOR EDUCATION AND TRAINING	Incentives comprise four levels (0–3), representing the proportion of the education and training increase objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl ¹
EDUCATION AND TRAINING INCREASE	Percentage of increase in education and training index (number of people educated and trained divided by total population) to be achieved by the final year of policy implementation	%
INCREASE SOLAR CAPACITY	Increase in solar energy capacity (not including rooftop PV) to be achieved by the final year of policy implementation	MW
INCENTIVES FOR SOLAR CAPACITY	Incentives comprise four levels (0–3), representing the proportion of the increase in solar energy objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
INCREASE WIND CAPACITY	Increase in wind energy capacity to be achieved by the final year of policy implementation	MW
INCENTIVES FOR WIND CAPACITY	Incentives comprise four levels (0–3), representing the proportion of the increase in wind energy objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
INCREASE ROOFTOP PV CAPACITY	Increase in rooftop PV energy capacity to be achieved by the final year of policy implementation	MW
INCENTIVES FOR ROOFTOP PV CAPACITY	Incentives comprise four levels (0–3), representing the proportion of the increase in rooftop PV energy objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
INCREASE BIOMASS CAPACITY	Increase in biomass energy capacity to be achieved by the final year of policy implementation	MW
INCENTIVES FOR BIOMASS CAPACITY	Incentives comprise four levels (0–3), representing the proportion of the increase in biomass energy objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
INCREASE HYDRO CAPACITY	Increase in hydropower energy capacity to be achieved by the final year of policy implementation	MW
INCENTIVES FOR HYDRO CAPACITY	Incentives comprise four levels (0–3), representing the proportion of the increase in hydropower energy objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
DECREASE NON-RENEWABLES CAPACITY	Decrease in non-renewable energy capacity to be achieved by the final year of policy implementation	MW
CARBON TAX	Incentives comprise four levels (0–3), representing the proportion of the decrease in non-renewable energy objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
H2 POLICY	Percentage of H ₂ in renewables to be achieved by the final year of policy implementation	%

¹ Dmnl = Dimensionless

Policy	Definitions of policies' objectives and incentives	Units
INCREASE ENERGY EFFICIENCY	Increase in energy efficiency (affecting energy consumption) to be achieved by the final year of policy implementation	%
INCENTIVES FOR ENERGY EFFICIENCY	Incentives comprise four levels (0–3), representing the proportion of the energy efficiency objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
INCENTIVES FOR DECREASE ENERGY EMISSIONS	Incentives comprise four levels (0–3), representing the decrease in energy emission factors to be achieved by the end of the final year of policy implementation: level 0 = 20%, 1 = 40%, 2 = 60%, and 3 = 80%	Dmnl
ENERGY SHARE TRANSITION	Scenarios representing the share of energy consumption by source (carbon, oil, gas, and renewables). Three levels are defined: 0 = Gradual progress, 1 = Good progress, 2 = Best progress (100% renewables)	Dmnl
INVESTMENT IN TOURISTIC INFRASTRUCTURE	Percentage increase in touristic infrastructure capacity (touristic accommodation rooms) to be achieved by the final year of policy implementation.	%
INVESTMENT FOR TOURISM ADAPTATION AND RESILIENCE	Incentives comprise four levels (0–3), representing improvements in tourism adaptive capacity (index: 0 = low adaptation, 1 = high adaptation) to be achieved by the final year of policy implementation: 0 = 25%, 1 = 50%, 2 = 75%, 3 = 100%	Dmnl
PROMOTE ALL YEAR TOURISM OBJECTIVE	Percentage increase in year-round tourism (tourists more evenly distributed across all seasons in the model) to be achieved by the final year of policy implementation	%
PROMOTE DOMESTIC TOURISM SEASONAL OBJECTIVE	Percentage of increase in national tourists relative to total number of tourists to be achieved by the final year of policy implementation	%
FOREST MANAGEMENT	Increase in forest management (increased forest management reduces biomass decay in the model) to be achieved by the final year of policy implementation	%
INCENTIVES FOR FOREST MANAGEMENT	Incentives comprise four levels (0–3), representing the proportion of the forest management objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
EFFICIENT WATER DEMAND FROM AGRICULTURE	Percentage of reduction in agricultural water demand to be achieved by the final year of policy implementation	%
EFFICIENT WATER DEMAND FROM INDUSTRY	Percentage reduction in industrial water demand to be achieved by the final year of policy implementation	%
EFFICIENT WATER DEMAND FROM URBAN	Percentage reduction in urban (municipality and tourism) water demand to be achieved by the final year of policy implementation	%
INCENTIVES FOR EFFICIENT WATER DEMAND FROM URBAN	Incentives comprise four levels (0–3), representing the proportion of the efficient water demand from urban objective achieved: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
WATER TREATMENT INCREASE	Increase in wastewater treatment to be achieved by the final year of policy implementation	hm ³
TRANSBOUNDARY WATER (Murcia)	Conditions defined for the Murcia case study refer to the Tajo–Segura water transfer. Four levels (0–3) are specified based on the transferred volume: level 0 = 60 hm ³ , level 1 = 27 hm ³ , level 2 = 20 hm ³ , and level 3 = 0 hm ³	Dmnl
TRANSBOUNDARY WATER (Others)	Contribution of transboundary water to be achieved by the final year of policy implementation. Applicable to all case studies except Murcia, where transboundary water is represented through TRANSBOUNDARY WATER CONDITIONS	hm ³
DESALINATION INCREASE	Increase in water desalination to be achieved by the final year of policy implementation	hm ³
SUSTAINABLE SNOWMAKING AND CONSERVATION PRACTICES	Percentage reduction in artificial snow production (related to conservation practises like snow farming) to be achieved by the final year of policy implementation	%

Policy	Definitions of policies' objectives and incentives	Units
WATER USE DECREASE IN SNOW PRODUCTION	Percentage reduction in water use for snow production (related to technical improvements in snowmaking equipment) to be achieved by the final year of policy implementation	%
ENERGY USE DECREASE IN SNOW PRODUCTION	Percentage reduction in energy use for snow production (related to technical improvements in snowmaking equipment) to be achieved by the final year of policy implementation	%
INCENTIVES FOR INCREASE IN ELECTRIC VEHICLES	Incentives comprise four levels (0–3), representing the increase in electric vehicles to be achieved by the final year of policy implementation: level 0 = 25%, 1 = 50%, 2 = 75%, and 3 = 100%	Dmnl
FLOOD DEFENSES FOR URBAN LAND	Switch of flood defences for urban land. When activated the damage caused by flood in urban areas is reduced	Dmnl

Policy effects on key variables

This section provides a detailed description of the direct and indirect effects associated with the implementation of each policy included in the NEVERMORE Local System Dynamics (SD) model. For each policy, the mechanisms through which it influences the system, as well as the resulting interactions and feedback effects across sectors, are described:

- The policy **INCREASE PROTECTED FOREST LAND** when applied increases the value of PROTECTED FOREST LAND, causing a reduction of AVAILABLE FOREST LAND for the expansion of AGRICULTURE.
- The policy **SUBSIDIES FOR AFFORESTATION** when applied, increases the area of FOREST land at the expense of AGRICULTURE land. This expansion of FOREST area also leads to an increase in BIOMASS STOCK and, consequently, TOTAL CARBON STOCK.
- The policy **INCREASE PROTECTED WETLANDS** when applied increases the value of PROTECTED WETLANDS, causing a reduction of AVAILABLE WETLANDS for the expansion of AGRICULTURE.
- The policy **GREEN URBAN PLANNING** when applied increases the value of GREEN URBAN land and reduces the BUILT-UP URBAN area. The policy also reduces the SENSITIVITY FOR POPULATION indicator and, consequently, the RISK INDEX POPULATION, by lowering the vulnerability of the population to heatwaves through the provision of green areas, which are less heat-absorbing than built-up, cemented surfaces.
- The policy **WATER STORAGE INCREASE** when applied increases the value of WATER AREA and TOTAL RESERVOIR CAPACITY. The first variable can expand across FOREST, AGRICULTURE, URBAN or OTHER areas, while the increase in reservoir capacity reduces the REQUEST FROM GROUNDWATER EXTRACTION leads to an increase in GROUNDWATER RESOURCES. The increase in reservoir capacity also enhances the WATER SUPPLY, as runoff water can be collected and stored in the reservoir instead of flowing away. As a result, the WATER SECURITY indicator is also affected and may shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand. Additionally, the increase in water storage reduces CROPS SENSITIVITY and, as a consequence, the RISK INDEX CROPS, by decreasing the vulnerability of crops to drought conditions.
- The policy **INCREASE IRRIGATED CROP** when applied under conditions of ensured WATER SECURITY, increases the value of IRRIGATED CROP AREA and consequently reduces the RAINFED CROP AREA. The expansion of IRRIGATED CROP AREA lowers CROPS SENSITIVITY and, as a result, reduces the RISK INDEX CROPS, by decreasing the crop vulnerability to drought conditions. Additionally, it leads to an increase in WATER DEMAND FROM AGRICULTURE,

causing a reduction of total WATER DEMAND. As a result, the WATER SECURITY could be affected may shift from 1 (adequate water availability to fully meet demand) to 0 (insufficient water availability to meet demand) if water demand exceeds water supply. If the WATER SECURITY is not ensured, the policy INCREASE IRRIGATED CROP cannot be activated.

- The policy **INVESTMENT IN CROP ADAPTATION** when applied increases the value of CROPS ADAPTATION indicator and, as a result, reduces the RISK INDEX CROPS, by decreasing the crop vulnerability to drought conditions.
- The policy **CROP DIVERSIFICATION** when applied decreases the value of CROPS SENSITIVITY indicator and, as a result, reduces the RISK INDEX CROPS, by decreasing the crop vulnerability to drought conditions.
- The policy **EDUCATION AND TRAINING INCREASE** and **INCENTIVES FOR EDUCATION AND TRAINING** when applied increase the value of ADAPTATION FOR POPULATION indicator and, as a result, reduces the RISK INDEX POPULATION, by decreasing the population vulnerability to heatwaves conditions.
- The policies **INCREASE SOLAR CAPACITY** and **INCENTIVES FOR SOLAR CAPACITY** when applied, increase SOLAR PRODUCTION of energy and, as a result, TOTAL PRODUCTION of energy. These changes in energy production affect the energy balance by increasing EXPORT of energy and reducing IMPORT. The variables TOTAL PRODUCTION CONSIDERING H2, IMPORT WITH H2, and EXPORT WITH H2 are affected by the policies in the same way as the corresponding variables that do not consider H2. Additionally, these policies affect land use by increasing SOLAR LAND, which expands over OTHER areas and RAINFED CROP AREA, consequently reducing the area available for AGRICULTURE.
- The policies **INCREASE WIND CAPACITY** and **INCENTIVES FOR WIND CAPACITY** when applied, increase WIND PRODUCTION of energy and, as a result, TOTAL PRODUCTION of energy. These changes in energy production affect the energy balance by increasing EXPORT of energy and reducing IMPORT. The variables TOTAL PRODUCTION CONSIDERING H2, IMPORT WITH H2, and EXPORT WITH H2 are affected by the policies in the same way as the corresponding variables that do not consider H2.
- The policies **INCREASE ROOFTOP PV CAPACITY** and **INCENTIVES IN ROOFTOP PV CAPACITY** when applied, increase ROOFTOP PV PRODUCTION of energy and, as a result, TOTAL PRODUCTION of energy. These changes in energy production affect the energy balance by increasing EXPORT of energy and reducing IMPORT. The variables TOTAL PRODUCTION CONSIDERING H2, IMPORT WITH H2, and EXPORT WITH H2 are affected by the policies in the same way as the corresponding variables that do not consider H2.
- The policies **INCREASE BIOMASS CAPACITY** and **INCENTIVES FOR BIOMASS CAPACITY** when applied, increase BIOMASS PRODUCTION of energy and, as a result, TOTAL PRODUCTION of energy. These changes in energy production affect the energy balance by increasing EXPORT of energy and reducing IMPORT. The variables TOTAL PRODUCTION CONSIDERING H2, IMPORT WITH H2, and EXPORT WITH H2 are affected by the policies in the same way as the corresponding variables that do not consider H2.
- The policies **INCREASE HYDRO CAPACITY** and **INCENTIVES FOR HYDRO CAPACITY** when applied, increase HYDRO PRODUCTION of energy and, as a result, TOTAL PRODUCTION of energy. These changes in energy production affect the energy balance by increasing EXPORT of energy and reducing IMPORT. The variables TOTAL PRODUCTION CONSIDERING H2, IMPORT

WITH H2, and EXPORT WITH H2 are affected by the policies in the same way as the corresponding variables that do not consider H2.

- The policies **DECREASE NON-RENEWABLES CAPACITY** and **CARBON TAX** when applied, decrease NON-RENEWABLE PRODUCTION of energy and, as a result, TOTAL PRODUCTION of energy. These changes in energy production affect the energy balance by reducing EXPORT of energy and increasing IMPORT. The variables TOTAL PRODUCTION CONSIDERING H2, IMPORT WITH H2, and EXPORT WITH H2 are affected by the policies in the same way as the corresponding variables that do not consider H2.
- The **H2 POLICY** when applied, increases the value of H2 PRODUCTION. This leads to a decrease in TOTAL PRODUCTION, as it consumes energy generated from solar, wind, and hydro sources. The resulting total production is represented by the new variable TOTAL PRODUCTION CONSIDERING H2. Based on this updated production variable, a new energy balance is defined, taking into account H2 production, and the corresponding values of IMPORT WITH H2 and EXPORT WITH H2 are considered. In addition, H2 production requires water, leading to an increase in WATER DEMAND. As a result, WATER SECURITY may be affected and could shift from 1 (adequate water availability to fully meet demand) to 0 (insufficient water availability to meet demand) if water demand exceeds water supply.
- The policies **INCREASE ENERGY EFFICIENCY** and **INCENTIVES FOR ENERGY EFFICIENCY** when applied, reduce ENERGY CONSUMPTION. This, in turn, decreases TOTAL CARBON EMISSIONS FROM ENERGY, as lower energy consumption leads to reduced emissions.
- The policy **DECREASE ENERGY EMISSIONS** when applied reduces the value of TOTAL CARBON EMISSIONS FROM ENERGY.
- The policy **ENERGY SHARE TRANSITION** when applied reduces the value of TOTAL CARBON EMISSIONS FROM ENERGY by shifting energy consumption from non-renewable sources (oil, gas, coal) to renewable sources.
- The policy **INVESTMENT IN TOURISTIC INFRASTRUCTURE** when applied, increases the value of INFRASTRUCTURE CAPACITY and, as a consequence, the number of TOTAL ROOMS available for tourism purposes.
- The policy **INVESTMENT IN TOURISM ADAPTATION AND RESILIENCE** when applied increases the value of tourism ADAPTIVE CAPACITY and, as a result, reduces the RISK INDEX TOURISM, by decreasing the tourism vulnerability to extreme events conditions.
- The policy **PROMOTE ALL-YEAR TOURISM** when applied increases the value of when applied increases the value of tourism ADAPTIVE CAPACITY and, as a result, reduces the RISK INDEX TOURISM, by decreasing the tourism vulnerability to extreme events conditions.
- The policy **PROMOTE DOMESTIC TOURISM** when applied increases the value of tourism ADAPTIVE CAPACITY and, as a result, reduces the RISK INDEX TOURISM, by decreasing the tourism vulnerability to extreme events conditions.
- The policies **FOREST MANAGEMENT** and **FOREST MANAGEMENT INCENTIVES** when applied, reduce the biomass decay rate, resulting in an increase in BIOMASS STOCK and, consequently, TOTAL CARBON STOCK.
- The policy **EFFICIENT WATER DEMAND FROM AGRICULTURE**, when applied, decreases the value of WATER DEMAND. This causes an increase in STORAGE WATER and a reduction in REQUEST FROM GROUNDWATER EXTRACTION, leading to an increase in GROUNDWATER RESOURCES. The effects on WATER DEMAND may have implications for WATER SECURITY,

which can shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand.

- The policy **EFFICIENT WATER DEMAND FROM INDUSTRY** when applied, decreases the value of WATER DEMAND. This causes an increase in STORAGE WATER and a reduction in REQUEST FROM GROUNDWATER EXTRACTION, leading to an increase in GROUNDWATER RESOURCES. The effects on WATER DEMAND may have implications for WATER SECURITY, which can shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand.
- The policies **EFFICIENT WATER DEMAND FROM URBAN** and **INCENTIVES FOR EFFICIENT WATER DEMAND FROM URBAN** when applied, decrease the value of WATER DEMAND. This causes an increase in STORAGE WATER and a reduction in REQUEST FROM GROUNDWATER EXTRACTION, leading to an increase in GROUNDWATER RESOURCES. The effects on WATER DEMAND may have implications for WATER SECURITY, which can shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand.
- The policy **WATER TREATMENT INCREASE** when applied, increases the value of WATER SUPPLY. These effects may have implications for WATER SECURITY, which can shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand. The policy also reduces REQUEST FROM GROUNDWATER EXTRACTION, leading to an increase in GROUNDWATER RESOURCES. The implementation of this policy requires energy consumption, resulting in an increase in ENERGY CONSUMPTION and, consequently, an increase in TOTAL CARBON EMISSIONS FROM ENERGY when the additional energy demand is met by non-renewable energy sources.
- The policy **TRANSBOUNDARY WATER** when applied, increases the value of WATER SUPPLY. These effects may have implications for WATER SECURITY, which can shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand. The policy also reduces REQUEST FROM GROUNDWATER EXTRACTION, leading to an increase in GROUNDWATER RESOURCES. TRANSBOUNDARY WATER also affects HYDRO PRODUCTION, as the increased availability of water extends the period during which hydropower can be generated, thereby increasing overall energy production from hydropower.
- The policy **DESALINATION INCREASE** when applied, increases the value of WATER SUPPLY. These effects may have implications for WATER SECURITY, which can shift from 0 (insufficient water availability to meet demand) to 1 (adequate water availability to fully meet demand) if water supply exceeds water demand. The policy also reduces REQUEST FROM GROUNDWATER EXTRACTION, leading to an increase in GROUNDWATER RESOURCES. The implementation of this policy requires energy consumption, resulting in an increase in ENERGY CONSUMPTION and, consequently, an increase in TOTAL CARBON EMISSIONS FROM ENERGY when the additional energy demand is met by non-renewable energy sources.
- The policy **SUSTAINABLE SNOWMAKING AND CONSERVATION PRACTICES**, when applied, decreases the value of ARTIFICIAL SNOW PRODUCTION, resulting in lower WATER DEMAND and reduced ENERGY CONSUMPTION associated with snowmaking activities.
- The policy **WATER USE DECREASE IN SNOW PRODUCTION** when applied decreases the value of WATER DEMAND associated with snowmaking activities.

New Enabling Visions and Tools for End-users and stakeholders thanks to a common
MOdeling appRoach towards a ClimatE neutral and resilient society

- The policy **ENERGY USE DECREASE IN SNOW PRODUCTION** when applied decreases the value of ENERGY CONSUMPTION associated with snowmaking activities.
- The policy **INCREASE IN ELECTRIC VEHICLES** when applied increases the value of electric vehicles and, as a consequence, decreases the TOTAL EMISSIONS FROM TRANSPORT.
- The policy **FLOOD DEFENSES FOR URBAN AREAS** when applied decreases the value of EXPECTED LOSSES BY FLOODS.
